### ADVERTISEMENT.

THE present work is offered to the Agricultural community, with perfect confidence. After the most rigid test of experience, it is found to be accurate in all its parts, and of the most simple application to all circumstances. It will prove itself an invaluable "Companion" to the real, practical man; giving him the information he seeks in comparatively an instant of time, without the labour of working over long sums; and its application can be made while engaged in the labours of the field, without previous preparation.

To the possessors of large tracts of land in the West, or open country, its use will soon create a *necessity* for its aid; for, to be enabled to set off any quantity of 'and in a field containing, perhaps, a hundred acres, in a few minutes of time, merely by stepping it and putting down four stakes; as also, to ascertain as quickly the quantity of land that has been ploughed, or planted, or cleared, out of the same tract; is an advantage, not to be appreciated until it shall have been enjoyed.

It is printed in the present form and size, that it might become "The Farmer's Pocket Companion" in reality.

> C. M. SAXTON, 152 Fulton Street, New York.

### PREFACE.

This work consists of Tables, so constructed as to give the content of any regular piece of land, measuring from one yard in length and breadth, to five hundred, by the addition of not more than three sums. And should the length or breadth exceed five hundred yards, its content may readily be found, by observing the rules which will be given in the course of the work. And to render the book as useful as possible, the preference is given to the use of yards, rather than to rods, or chains and links: as all farmers can tell the length and breadth of a piece of land by pacing or stepping it; therefore, in most cases, the content of a field might thus be known, without using rod or chain, sufficiently exact for paying labourers' wages; ascertaining the quantity of land ploughed in any given time; manuring, or apportioning seed at the time of sowing, as well as for harvesting the crops; without the necessity of employing a person to survey and measure - thus settling trifling disputes between masters and workmen, to the satisfaction of both, without calling in the aid of a third party.

There is added a table, which shows at one view what width is necessary to form a square of land of one acre,

#### PREFACE.

from one yard in length to five hundred. This is another mode of ascertaining the quantity of seed sown per acre; and the convenience of these tables will be very great, in showing the quantity of corn, grain, roots, &c., grown upon an acre; for it is only to step off, in any average part of the field, eleven vards square, and weigh or measure the produce, and forty times that quantity will be the exact product of an acre: - thus, if a bushel of barley, &c., be obtained from eleven yards square, the crop per acre will be ten bags of four bushels each, or forty bushels: then, by stepping the remainder of the field, and turning to the tables, the product of the whole field can be ascertained most easily. Again, if such a piece of land - namely, eleven yards square - produce three bags of potatoes, the produce per acre will be one hundred and twenty bags. Beets, turnips, carrots, parsneps, &c., may be weighed, and the quantity ascertained in a few minutes, by the same means. And when a farmer intends to plough an acre of land for his day's work, it is only to ascertain the *length* of the land ly stepping, turn to the table to find the width necessary to form the acre, step that also, and place a rod at the spot; and he will derive much pleasure and interest from witnessing the progress which he is making towards the fulfilment of his task. This plan can be adopted at the time of harvest, creating great emulation amongst the persons employed, particularly if bands of workmen are engaged in different parts of the field; and in this way lightening materially their labour, by keeping alive a spirit of rivalry.

Added to these, are Tables for Manuring Land, showing how many loads will be required to cover an acre, the heaps being dropped at given distances, and the number of heaps in a load being first ascertained. A Table, showing the number of Plants required to plant an Acre. A Time Table, showing most accurately how to keep the time of any number of workmen, with the greatest ease and facility. Tables for Ploughing, &c., &c.; and a Table of the Measurement of the Bushel, showing when it is too large and when too small, according to the imperial standard of measurement; with many other things which will be found of great interest to the agriculturist.

JAMES PEDDER. January, 1854.

### FARMER'S POCKET COMPANION.

### METHOD OF MEASURING LAND.

THE content of land is estimated in acres, roods, and perches, forty of which perches make one rood, and four roods make one acre. In adding any different quantities of land into one sum, if the perches amount to more than forty and under eighty, set down the odd perches above forty, and carry one to the roods; if the perches exceed eighty and are under one hundred and twenty, set down the odd perches above eighty, and carry two to the roods; and so on, carrying one to the roods for every forty perches, and setting down the remainder under the perches. And if the roods, when added together, amount to more than four, carry one to the acre for every four roods, and set down the remainder under the roods,-The following examples will suffice for elucidation :----

| First | Exa | mple. | Secon | d Ex | ample | Thir | d Ex | ample. |
|-------|-----|-------|-------|------|-------|------|------|--------|
| Α.    | R.  | Р.    | Α.    | R.   | Ρ.    | А.   | R.   | Р.     |
| 8     | 1   | 16    | 3     | 2    | 14    | 5    | 2    | 18     |
| 3     | 2   | 24    | 4     | 3    | 15    | 4    | 1    | 36     |
| 1     | 2   | 14    | 3     | 1    | 9     | 6    | 0    | 28     |
| 13    | 2   | 14    | 11    | 2    | 38    | 16   | 1    | 2      |

In the first example, the perches when added together amount to fifty-four; these being one rood and fourteen perches, I set down the fourteen under the perches, and carry one to the roods, which will make the roods six, or one acre two roods, which is the reason of the two being placed under the roods, the one being carried to

(9)

the acres, which will then be found to be thirteen-say therefore, 13 acres 2 roods and 14 perches.

Second example-The perches amount to thirty-eight; these being less than forty, or one rood, I set down the thirty-eight under the perches, and carry none to the roods: the roods amounting to six, I set down two to the roods, and carry one to the acres, which will be found to be eleven-say therefore, 11 acres 2 roods and 38 perches.

Third example - The perches amount to eighty-two. I now set down two under the perches, and carry two to the roods, which will make the roods five: I therefore set down one under the roods, and carry one to the acres, which will then be sixteen-say therefore, 16 acres 1 rood and 2 perches.

It will now be shown how the content of various pieces of land and of different figures may be found by the following tables :---

When the piece to be measured is a square, like the annexed figure, measure the length and breadth in the middle, as there described. - Now, suppose the length from A to B to be 174 yards, breadth from C to D 87 yards, then turn to the column in the tables under 174 yards long, take out the sum which stands opposite 80 yards in width, and also out of the same column the sum which stands opposite 7 yards wide, and the two sums added together will give you the content of the field, namely, thus:-

Content.

Or, if a field of the same figure be 287 yards long and 154 yards wide, the content will be—

| 287 yards long, | 100 yards v<br>50 do.<br>4 do | wide     | A. R. P.<br>5 3 29<br>2 3 34<br>0 0 38 |
|-----------------|-------------------------------|----------|--|
|                 |                               | Content, | 9 0 21                                 |

Again—If the field be wider at one end than at the other, as in the figure here represented, measure the length in the middle, as in the first example, from A to B, and the breadth in the middle from C to D, and find the content as before. Now, suppose the length to be 303 yards, breadth C 124 yards, the content will be—

But the breadth in the middle might have been found by measuring both ends and adding them together, and taking half their sum for a mean breadth—thus: If the larger end be 146 yards wide, and the lesser end be 102 yards wide, their sum would be 248 yards, the half of which is 124 yards for a mean breadth, as above; but the method above described is a shorter way to come at the result. Once more — If one side of a piece of land be longer than the other, take the length and breadth exactly in the middle, and you will be able to find the content precisely as in the last example.— Now, suppose the length from A to B 318 yards, the breadth from C to D 129 yards—

 $318 \text{ yards long} \begin{cases} 100 \text{ yards wide.} & 6 & 2 & 11 \\ 20 & \dots & d0 & \dots & 1 & 1 & 10 \\ 9 & \dots & d0 & \dots & 0 & 2 & 15 \\ Content. & 8 & 1 & 36 \end{cases}$ 

The content of the triangle is found by measuring the longest side, and also the nearest or perpendicular distance from the said side to the corner *opposite* to the said side; and in finding the content, observe to take only one half the perpendicular **B** for a mean width.—Now, sup-

pose the longest side, B C, be 417 yards, and the perpendicular, A D, be 326 yards, the half of which is 163 yards for a mean width; then—

 $\begin{array}{c} \text{A. R. P.} \\ 417 \text{ yards long and} \begin{cases} 100 \text{ yards wide, is } 8 \text{ 2 19} \\ 60 \dots \text{do} \dots \text{do} \dots \text{ 5 0 27} \\ 3 \dots \text{do} \dots \dots \text{ 0 1 1} \\ \end{array}$ 

And the content of any field, having four straight sides, may be found by the same rule :--measure the distance

ħ

across the field from one longest corner to the other, which will throw it into two triangles; then measure the nearest or perpendicular distance from each of the other corners, to the line measured across the longest part of the field, and find the content of the two triangles as before: or, add the two perpendicular distances to-

gether, and take half the sum, which may be considered a mean width. and the line measured across the field being the length-thus:

If the distance A B be 298 yards, the perpendicular distance C E 117 yards, and the perpendicular D F 113 yards, then 117 and 113 added together make 230, the half of which is 115 yards for a mean width: then-

A. R. P. 298 yards long and  $\begin{cases} 100 \text{ yards wide, is } 6 \text{ 0 } 25\\ 10 \text{ ...do..... } 0 \text{ 2 } 19\\ 5 \text{ ...do.... } 0 \text{ 1 } 9 \end{cases}$ Content, 7013

A field of any number of sides may be divided into triangles by measuring lines across it; and its content may then be found by the foregoing rules. and the second second

If the field have five sides. the lines A C and C E will divide it into three triangles. and its content is then found as follows:-Suppose A C 402vards, BG154, EF 162, EC 303, and D H 137 - Now, to find the content of the parts A B, C E, we have

B G 154, and E F 162, the sum of which is 306, and the half of this is 158 for a mean width; then—

 $\begin{array}{c} \text{A. R. P.} \\ 402 \text{ yards long and} \begin{cases} 100 \text{ yards wide, is } 8 1 9 \\ 50 \dots do \dots 4 0 24 \\ 8 \dots do \dots 0 2 26 \end{cases}$ 

Content of the parts A B, C E, 13 0 9

And to find the content of the triangle E C D, we have D H 137 yards, the half of which is 68 yards for a mean width, and the length E C 303 yards—

|  | A.             | , R. | r. |
|--|----------------|------|----|
| 303 yards long and 60 yards wide                     | 3              | 3    | 1  |
| dodo 8do   | 0              | 2    | 0  |
| Content of triangle E C D,<br>do. of the other part, | $\frac{1}{13}$ | _    | 19 |
| Whole content,                                       |                | 1    | 20 |

14

And in the same manner, a field of six, seven, or eight sides, may be divided into triangles by measuring lines across it; but to those unacquainted with land surveying, it would be best to take, if a ploughed field, a number of ridges at a time, and find their content by some of the first rules; then take more ridges and find their content also, until all the ridges are taken, and the summing up of the whole will be the content of the field.

Hitherto, the fences have always been considered as straight; but as it frequently happens that pieces of land are bounded by curved lines or fences, it is necessary to show how the content of such pieces can be found by these tables. And to do which, first set up a mark at each corner of the field; or, if the fence or line bend inward, then, as near the corner as possible, so as to be able to see the mark at the other end of the said fence or line, without being prevented by the curvature of the same: then find the content of the piece withinside of the said mark by some of the foregoing rules, and for the curved part measure the distance in a straight line from one mark to the other, against each of the curved fences-observing to set down the distance that your mark stands from the said fence where you first set off: and also note down the distance which the straight line you are measuring is from the fence or line, at every fifty yards distance in length; but if the fence be very irregular, take down the distance at every twenty or thirty yards in length, and also the distance at the end of the straight line; and in finding the content of the curve, set down every distance twice which was taken from the fence, except the distances taken at each end, which set down only once; then add them all together. and divide the sum by the number of lines added up, which gives the mean width of the curve, and the straight line measured against it is the length; thusSuppose a field to be in the A hape of the figure annexed, the ength in the middle being 148 vards, the end A B 88 yards, he end C D 94 yards, and the straight line B D 154 yards; the listance from the straight line to the curve at B nothing, at E 18 yards, at F 13 yards, and at the end D, nothing: then, for the content of the square part the length is 148 yards, and the two ends when added together make 182 yards, the half of which is 16 or the mean width.—Again, C

r the curve, the length is 154; and the off-sets, by the resaid rule, will stand thus—

| 0    |  |
|------|--|
| 18   |  |
| 18   |  |
| 13   |  |
| 13   |  |
| 0    |  |
|      |  |
| 6)62 |  |
|      |  |

10 the mean width of the curve.

 $\begin{array}{c} \text{A. R. P.} \\ 148 \text{ yards long and} \begin{cases} 90 \text{ yards wide, is. } 2 \ 3 \ 0 \\ 1 \ \dots \ 0 \ 0 \ 5 \end{cases}$   $\begin{array}{c} 154 \text{ yards long and } 10 \ \dots \ 0 \ 1 \ 11 \\ \end{array}$   $\begin{array}{c} \text{Whole content, } 3 \ 0 \ 16 \end{array}$ 

Again, suppose a piece of land of the following shape and dimensions: — A D 232 yards, B E 143 yards, C F 84 yards, and B D 200 yards; the distance from the straight line B D to the curve at B, nothing, at G 15 yards, at H 8 yards, at I nothing, and at the end D 14 yards; also, the line A C 160 yards long, and the distance from the end A of the straight line to the

17

curve 23 yards, at L nothing, at M nothing, and at the end C 11 yards. From these dimensions, the content is found in the following manner :—The two perpendicular distances B E and C F, when added together, make 227, the half of which is 113 for a mean width of the square part: and to obtain a mean width of the curves, the offsets will stand in the following manner :—

| 0                       |                            |
|-------------------------|----------------------------|

A. R. P.

 $\begin{array}{c} 100 \text{ yards wide, is } 4 \ 3 \ 7 \\ 232 \text{ yards long and} \\ \begin{array}{c} 100 \text{ yards wide, is } 4 \ 3 \ 7 \\ 10 \ \dots \ do \dots \ 0 \ 1 \ 37 \\ 3 \ \dots \ do \dots \ 0 \ 0 \ 23 \\ 200 \text{ yards long and} \ 7 \ \dots \ do \dots \ 0 \ 1 \ 6 \\ 160 \ \dots \ do \dots \ 0 \ 0 \ 32 \end{array}$ 

Content of the whole field, 5 3 25

The content of various pieces of land of still more difficult measurement may be readily found by these tables; but as the present work is designed for the *practical Farmer*, and not for the *surveyor*, the subject need not be farther pursued.

If the length of a piece of land be more than 500 yards, the content may easily be found by the tables: — first marking off 500 yards in length, and adding the width, and then taking the remaining length above the 500 yards in length: and the sums added together will give the content of the whole field. Now, if for instance, the field be 738 yards long, and width 576, say—

|                      | A. R. P.  |
|----------------------|---|
| (                    | 500 yards wide, is 51 2 24<br>70do 7 0 37   |

|                      | ntent of the field, $\overline{87\ 3\ 12}$  |
| 0                    | intent of the neld, of 5 12   |

To prove the truth of any of the following tables, multiply the length and breadth together, and divide the product by 4840—the number of square yards contained in an acre, and the quotient gives the number of acres; then multiply what remains by 4, and the product divided as before gives the roods; and the last remainder, if multiplied by 40 and divided in like manner, gives the perches. — Thus, by making<sup>\*</sup> use of the last example, where the length was 738 yards, and the width 576 yards—

|      | 738<br>576                   |           |    |    |

#### A TABLE

#### SHOWING

#### THE WIDTH REQUIRED

#### FOR AN

### ACRE OF LAND,

#### FROM

ONE TO FIVE HUNDRED YARDS IN LENGTH.

#### EXPLANATION OF THE TABLE.

FIRST, find the length of the piece in yards in the table, and opposite it stands the width, in yards, feet, and inches, required for an acre corresponding with that length :— Thus, if the length be 278 yards, then against it is 17 yards, 1 foot, 3 inches—the width to make an acre.

The width for two, three, or more acres, may be found by doubling, trebling, &c., the width for one acre; also, the width for half or a quarter of an acre is found by taking the half or the quarter of the width for an acre.

Suppose the length of a square piece of land is 162 yards, then the width for an acre is 29 yards, 2 feet, 8 inches, the double of which is 59 yards, 2 feet, 4 inches, the width for two acres. The treble of it is 89 yards, 2 feet, 0 inches, the width for three acres.—Also, the half of it is 14 yards, 2 feet, 10 inches, the width for half an acre. The quarter of it is 7 yards, 1 foot, 5 inches, the width for a quarter of an acre.

The width for three quarters of an acre is found by taking the width for half and a quarter of an acre, and adding them together.

## From 1 to 100 Yards in Length.

#### TABLES

#### FOR

#### MANURING LAND.

#### EXPLANATION OF THE FIRST TABLE.

The left-hand column shows the distance of the heaps of manure in yards, the figures at the top the number of heaps in a load, and under them the number of *loads* required for an acre for any given distance of the heaps : —thus, if heaps of clay are set  $3\frac{1}{2}$  yards asunder, and 5 heaps made of a load, then under five in the table, and opposite  $3\frac{1}{2}$  yards in the width, you will find 80, which shows the number of loads required for an acre. Again, if the heaps of dung are 7 yards distant from each other, and 8 heaps made of a load, the table shows that 13 loads are required to manure an acre.

#### EXPLANATION

#### OF THE

#### SECOND TABLE FOR MANURING LAND.

THE first of these tables is made on the supposition that the distance of the rows of manure is equal to the distance of the heaps from each other; but as this is not always the case, particularly in arable lands, where the furrows are visible, the following table will show the number of *heaps* required to cover an acre, for any given width of the rows and distance of the heaps from each other.

Having found the width of the rows in the figures placed at the top of the columns, and the distance of the heaps in the column on the left-hand side; then immediately under the former, and opposite the latter, stands the number of heaps required for an acre:—Thus, if the rows are  $7\frac{1}{2}$  yards wide, and the heaps 6 yards from each other, then under  $7\frac{1}{2}$  in the table, and opposite 6, we find 108, the number of heaps for an acre; and if this number be divided by the number of heaps made of a load, it will then show the number of loads laid on an acre.

In like manner, the number of heaps on an acre is found by the table for any other given width of the rows and distance of the heaps.

In the foregoing table a *less* number of loads, and in the following table a *less* number of heaps will not cover an acre; although, in some instances, the numbers set down in the tables will cover a small quantity more than an acre.

#### EXPLANATION.

When the land is no more than 78 yards long, 4 hours and 39 minutes are spent merely in turning at the ends, in a journey of 8 hours; whereas, when the land is 274 yards long, 1 hour and 19 minutes are sufficient for that purpose in the same length of time.

The whole series of furrows on an acre of land, supposing each to be 9 inches in width, would extend in length to 19,360 yards; and, adding 12 yards to every 220, for the average estimated ground travelled over in turning, the whole work of ploughing one acre may be given as extending to 20,416 yards, or 11 miles and hearly five furlongs.

#### **OVERSEER'S ACCOUNT OF TIME.**

The time of any number of workmen may be kept with most perfect accuracy, and in the simplest manner, by the following mode:

Proceire a slate, and mark upon it by incans of a sharp-pointed instrument, so that they shall be deeply indented, the following straight lines and crosses. The workmen's names, together with the rate of wages, are to be added with pencil; and on the evening of each day, the filling up of segments of circles with the same must take place, according to the time each man has been employed, together with any remarks that may follow. At the end of the week every man's time is thus ascertained, without the possibility of mistake or misunderstanding; and after all is settled, the application of a wet sponge makes ready for another week, the crosses remaining indented in the slate.

#### THE RIGHT-ANGLE.

Every Farmer ought to know before he crects a house or any other building, how to lay off the sills in an exact square. He must measure off 8 feet from the end of one sill, and there make a mark; he then measures off 6 feet on the sill lying at right angles with the first, and makes another mark; he then lays on a 10 feet pole, one end of it squaring with the first mark—and if the other end of it does not exactly meet the second mark, he moves the sill in or out, until it exactly squares with it. The figure which he thus makes in marking off his sills and in laying down his 10 feet pole, is a right-angled triangle, A, B, C; the right-angle or square corner being at B.

Now, unless the line A C be 10 fect long when the other two are 8 and 6 respectively, the corner B will not be a square corner; for it is found by mathematicians, that in every right-angled triangle, the longest line—the line opposite to the rightangle—when squared, is just equal to the squares of the other two, the lines A B and B C. This is the reason why carpenters ndopt this rule to lay their silk square -8 squared being 64, and 6 squared, 36; both together being 100—ten squared being 100, ten times ten,

#### MEASUREMENT OF CORN IN THE CRIB.

After leveling the corn, multiply the length and breadth of the house together, and the product by the depth, which will give the cubic feet of the balk of corn : then divide this hast product by 12, and the quotient will be the number of barrels of shelled corn contained in the house or crib. If there be a remainder after the division, it will be so many twelfths of a barrel of shelled corn over.

|       | Example.                  |
|-------|---------------------------|
| 12    | feet long                 |
| 11    | feet broad                |
|       |                           |
| 132   |                           |
| 6     | feet deep                 |
| -     |                           |
| 2)792 | cubic feet                |
|       |                           |
| 66    | barrels of shelled corn   |
|       | bushels in a barrel       |
|       | building in a builter     |
| 330   | bushels of shelled corn.  |
|       | pusiters of sherica corn, |

12

Memoranda. -21,500 cubic inches will contain ten bushels of shelled corn, but the same space filled with corn in the ear will shell out rather more than five bushels. These 21,500 cubic inches contain 12 cubic feet, and 764 cubic inches over. Now, two barrels, or ten bushels in the ear, will generally, in shelling, overrun just about these 764 cubic inches.

12\*

#### THE SPAN LEVEL, FOR DRAINING.

To fit the instrument for giving descent to a drain, place it so that the plummet or bob-line shall fall into the mark on the brace-piece; then place a block an inch thick under one of the feet, and mark the place where the line crosses the brace; then add another inch block, and mark again, repeating the operation as often as it is wished; then take out the blocks, and go over the process again, by placing them one at a time under the contrary foot, making the necessary marks on the brace ; the lines should then be numbered 1, 2, 3, &c. from the middle. Now, when the Level is so placed that the bob-line falls on mark No. 1, or that nearest the middle line, it is evident that the end of the instrument nearest the bob-line will be one inch lower than the other; and when on No. 2, two inches, &c. And if the span of the feet be made 16 feet 6 inches, or one perch, and the lines marked as above, the plummetline, resting on mark No. 1, shows a fall or rise of one inch to the perch, which is 26 feet 8 inches to the mile; when resting on mark No. 2, two inches to the perch, &c. And if the span be 12 feet 41 inches, or three-quarters of a perch, the blocks used for raising in marking must be three-quarters of an inch thick, then each of the lines will show the same fall as above. The Level as above divided. will show the fall in certain proportions to a given length; but there are cases in draining where these relative proportions do not exist on the ground: thus, the above lines and their subdivisions would show a rise or fall of 6 ft. 8 in. 13 ft. 4 in. or 26 ft. 8 in. to the mile, and sundry others, by various additions of them together; but if the fall of the ground were found to be any number of feet and inches between these, it could not be properly proportioned in the drains by the use of the above lines ; but a ready way to obviate this difficulty, is to make the span 12 feet 6 inches, the 8th part of an 100 feet; then ascertain the number of inches of fall in 100 feet of the ground to be drained, and for every inch let one-eighth of an inch be allowed to the block used in raising the feet when making the slope marks; or let the block be as many eighths of an inch thick as there are inches fall in 100 feet-thus, if the fall in 100 feet be 6 inches, the block must be 6-8 or  $\frac{3}{4}$  of an inch; if 7 inches,  $\frac{3}{6}$ ; 8 inches, 1 inch, &c. An instrument of this length is more convenient than any other, and can be, by the above method, at any time adapted to any case that might occur; the principle being simply to find the fail of a portion of the ground to be drained equal in length to the span of the instrument, and apply a block in making the marks equal in thickness to that fall.

#### A TABLE

#### SHOWING HOW MUCH THE

### **BUSHEL IN COMMON USE CONTAINS**

MORE OR LESS (IN PINTS),

THAN THE

STANDARD IMPERIAL BUSHEL.

139

#### THE IMPERIAL BUSHEL.

The various disputes which frequently arise respecting the measure of grain, by reason of the great diversity of form of the bushel in common use amongst merchants, farmers, millers, and others, rendering it oftentimes next to impossible to know correctly whether it be too large or too small-one being quite as likely to happen as the other, even in the hands of well-disposed persons-the following table has been drawn up for the purpose of settling the question. By reference to this, any one can satisfy himself of the capacity of his own or his neighbour's measure, while in the act of buying or selling, with the greatest exactitude. The form of the bushel was originally 19<sup>1</sup>/<sub>2</sub> inches in diameter, and of sufficient internal capacity to hold eight gallons: but it was found extremely inconvenient for the purpose of measuring grain into bags, &c. being too broad and shallow ; the bushels in common use are narrower, and in proportion deeper, so that the exact content shall be the same, be the depth and diameter what they may. But as no one could easily conceive the great and serious difference that even the eighth part of an inch in diameter in the bushel he uses will cause him, it is of importance that some ready mode should be adopted, by which every man may satisfy himself on the subject ; and it is with this view the following table is given, which shows the content of any bushel in pints and quarters of pints, of all the various diameters and depths that bushels in common use are to be met with : and as a bushel ought to contain exactly 64 pints, whatever the content in the table exceeds or falls short of that sum, will be what the bushel holds more or less than its proper quantity.

Explanation. The first column contains the diameter of the bushel in inches and parts of an inch; the second the depth, and the third its contents in pints. Thus, if a bushel be 15 inches in diameter, and  $12\frac{1}{2}$  inches in depth, its content will be  $63\frac{3}{4}$  pints, or one-quarter of a pint less than it ought to be. Again, if a bushel be  $15\frac{1}{2}$  inches in diameter, and 12 inches in depth, its content will be  $65\frac{1}{4}$  pints, or a pint and a quarter more than measure.

#### TO ASCERTAIN THE WEIGHT OF LIVE CATTLE.

First, see that the animal stands square, then, with a string, take his circumference just behind the shoulderblade, and measure the feet and inches—this is the girth. Then measure from the bone of the tail which plumbs the line with the hinder part of the buttock, and direct the string along the back to the forepart of the shoulder-blade. and this will be the length. Then, work the figures thus: -Suppose girth of bullock 6 feet 4 inches. length 5 feet 3 inches, which multiplied together make 33 square superficial feet; and these, multiplied by 23 — the number of pounds allowed for each superficial foot of cattle measuring less than seven and more than five feet in girth-make 759 lbs. When the animal measures less than nine and more than seven feet in girth, 31 is the number of pounds to be estimated for each superficial foot. And suppose a small animal to measure 2 feet in girth and 2 feet in length, these multiplied together make 4 feet, which, multiplied by *eleven*—the number of pounds allowed for each square foot when cattle measure less than three feet in girthmake 44 lbs. Again, suppose a calf or sheep, &c., to measure 4 feet 6 inches in girth, and 3 feet 9 inches in length, that multiplied together, makes 16 square feet, and these multiplied by 16, the number of pounds allowed for cattle measuring less than 5 and more than 3 feet in girth, make 256 lbs. The dimensions in girth and length of the back of cattle, sheep, calves and hogs, taken this way, are as exact as is at all necessary for common computation or valuation of stock, and will answer to the four quarters of the animal, sinking the offal. A deduction must be made for animals half fat, of one pound in twenty from those that are fat: and for a cow that has had calves. one pound must be allowed, in addition to the one for not being fat, upon every twenty.

THE END.
